Client Requirement

- Our client was a top government agency that takes security measures to safeguard its country by addressing /stopping all illegal activities and acting immediately on the crimes that happen on the streets.
- The iOS application will be installed in the mobile devices of the secret agents deployed by the government who track the violations and report it using tags on the real-time map.
- The client requirement was to develop an iOS application and an admin website to track the violations that were happening in the country and report it through the app.
- The admin shall report all these violations with the tagged location to the local police. The local police shall address the violations with necessary actions.

Existing Challenges

- The privacy was a concern as it was a government project and involved highly confidential data.
- Adding tags in the Google real-time map – The integration of the Tags into the Google map was challenging.
- Adding a custom angle to the Tags – Custom angle facilitates to set an angle on tags for agents to highlight the severity of the violation.
- Displaying the number of Tags to the admin – Calculating the number of tags in a specific spot and presenting it to the admin was a challenging task.
- Overlapping of tags in a particular location – If a specific spot has many violation hits, the number of tags will increase, causing tag overlapping.

Soft Suave's Solution

- **IOS Application**

  A mobile application for the iOS platform was developed with all the features integrated according to client' business requirements.

- **Admin Website**

  A website was created, especially for admin, to oversee all the users and the tags reported by the agents.

- **Custom Tags**

  Custom tags were enabled for the agents to use on the real-time Google maps and report the violations happening in a specific location.

- **Review & Ratings**

  Provided review and rating options to facilitate other agents to share their review and rate the severity of the violations.

Soft Suave's Approach

01 IOS Application

- Developed mobile app to create tags and report violations & crimes.
- The application displayed tags in real-time Google maps.
- The app had a feature to add details to the tags, which allowed agents to disclose more information.

02 Admin Website

- The admin website had overall control over the application and the activities of the agents.
- Admin was given access to add, edit, rate, and review any tags.
- Admin can activate, deactivate, create, and delete any user.

03 Tags

- Each tag can be customized according to the guidelines of the admin and the severity of the violation.
- The challenge of overlapping tags was solved by showing the number of tags when a specific spot was selected.
- Filter options were provided to categorize the tags according to the severity.
- The agents can add reviews and ratings to others' tags.
  The tags supported multiple languages.

04 Groups and Push Notification

- The Admin can only create groups.
- Admin can only assign users to the groups and a user can be in multiple groups.
- Admin can send any message to the users and groups with the help of push notifications.

05 User Registration

- Users cannot merely register with the application and start using it.
- Users must have an access code sent by admin to get into the application.
- Mail authentication is necessary to get the access code.

Bringing Delight To Customers

- As security was a significant concern, the development team was secluded from the other teams, and strict security measures were taken to make sure the data remained confidential throughout the project duration and even after deployment.
- The mock-up had a traditional style interface (suggested by the client). However, the development team suggested APEX by Angular to make the interface interactive. The client was impressed by the change in the interface.
- The accuracy of the tag placements dazzled the clients. The tags were down to the doorway accurate on any map, which was not expected by the client.
